ABSTRACT

A DECODER FOR A WIRELESS COMMUNICATION DEVICE

A decoder for a wireless communication device comprising a calculator for calculating the modulo of a linear approximation of a MAX* function; and a selector for selecting a MAX* output value from the group $a(n)\text{mod}F$, $b(n)\text{mod}F$, and the calculated modulo based upon a determination as to whether a predetermined threshold value for $|a(n) - b(n)|$ has been met, where $a(n)$ is a first state metric, $b(n)$ is a second state metric, C is the predetermined threshold value and F is a value greater than $|a(n) - b(n)|$.
